

Claim(s)

What I claim as my invention is an arm/shoulder brace to stabilize and support an injured shoulder subluxation. The invention consists of a cross of two fully adjustable lengths of aluminum pieces (or similar product) whereby the vertical piece is topped with a foam pad, similar to a crutch, which fits under the patient's axilia. The horizontal piece is used to rest the arm and can also accommodate a cast in the event that the arm is also injured. The vertical and horizontal pieces are secured to the patient with a belt clip. The invention is primarily designed to reduce patient pain following an injury or surgery.
